

AI Use Policy — Placement Cell

This policy sets out how students may and may not use AI tools in connection with placement activities. It is not intended to stop students from using AI — that would be unrealistic and unenforceable. It is intended to draw a clear line between AI that helps students present themselves honestly and AI that misrepresents who they are or what they have done. The classifications below follow the EU AI Act risk framework: Unacceptable, High-risk, Limited, and Minimal.

1. Student-AI scenarios — risk classification

#	Scenario	Tier	Reasoning
1	AI resume editing	Limited	Student's content is their own; AI polishes language only. Disclose in resume footer or cover note.
2	AI mock interviews	Minimal	Private practice, no recruiter involved. Free use, no obligations.
3	AI-written application essays	High-risk	Assessed on student's voice. Permitted with mentor sign-off and student declaration.
4	AI-coded GitHub portfolio	High-risk	Permitted only if student passes a 10-min oral code-walkthrough per project.
5	AI in graded assignments	Unacceptable / Limited*	Banned for ability-testing work. Limited with declaration for report-type tasks only.
6	AI-generated or inflated CGPA	Unacceptable	Falsification of academic record. Banned outright, no exceptions.
7	AI-cloned voice in interviews	Unacceptable	Identity fraud under IT Act 2000 S.66C. Banned outright.
8	AI for skills self-assessment	Minimal	Private self-reflection, nothing submitted anywhere. Free use.

2. What students may do

Students may use AI to polish resume language (with disclosure), rehearse interview answers, look up technical explanations for DSA or OS topics, build personalised study plans from a JD or syllabus, draft company-prep notes verified against official sources, and review their own code before submission. In all these cases the student remains the author of the work — AI is a tool, not a ghost-writer.

3. What students may not do

Fabricate experience. Students may not use AI to invent projects, internships, or roles they did not complete. Every item on a resume is subject to mentor oral defence; the student must explain technical decisions and walk through code before the resume is sent to recruiters.

Clone their voice. AI-synthesised audio or video in any interview context is banned. The placement cell asks recruiters to include a live unscripted segment in video submissions; any voice discontinuity is reported back to the cell.

Alter academic records. CGPA, marks, and transcripts are cross-checked against the college portal before every resume is approved. Any discrepancy is treated as falsification.

Ghost-write assessed essays. For SOPs, motivation letters, or any submission where the student's voice is the assessment criterion, AI may not write the text. Mentors compare voice against 2-3 prior writing samples; inconsistencies trigger a short oral review.

4. Enforcement

The placement cell will randomly select at least 20% of placed students each cycle for an oral portfolio defence. Students who cannot explain their own submitted work receive a written warning and have seven days to re-defend; a failed re-defence means placement support is withdrawn for that cycle. A first confirmed violation of the prohibited-use rules results in a warning logged to the student's placement record. A second violation in the same cycle results in full withdrawal of placement cell support — portal access, mock-interview slots, and

recruiter referrals.

We want to be honest: most private AI use cannot be detected, and this policy does not pretend otherwise. What we can enforce are the situations where AI creates a false impression in front of a recruiter. Beyond that, we rely on students understanding that misrepresentation discovered after joining a company ends careers far more decisively than any college policy ever could.
